# UPLC® Method Development and Validation

# Challenges of Method Development

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.™

- Methods are developed throughout the drug development process
  - Samples vary in complexity
  - Redundancy across organization
- Method development is costly and time-consuming
  - Desire to streamline processes to bring products to market faster
  - Faster chromatographic methods will improve profitability

# UPLC Technology Can Streamline Method Development

Waters

THE SCIENCE OF WHAT'S POSSIBLE.™

UPLC Technology enables faster method development

Methods can be developed in a single work day!

- Systematic scouting protocol involving pH, organic and column chemistry
- High-resolution sub-2  $\mu\text{m}$  column technology enables high resolution separations, faster
- Automated column and mobile phase selection

# Outline

- ■ Approaches Towards Method Development
- Selectivity and Retention Tools
  - Stationary Phase and Particle Substrate
  - Solvent
  - pH
- Method Development Strategy
- Applications
- Conclusions

# Approaches Towards Method Development

Waters

THE SCIENCE OF WHAT'S POSSIBLE.™

- Literature search, colleague, speculation?
- Stepwise iterative procedure
  - Next step experimental design based on results from previous experiment
- Systematic scouting
  - Evaluate pH, organic solvent and stationary phase
  - Select best combination of those three
  - Fine tuning/optimization (temperature, gradient slope)

# Desirable Information for Method Development

Waters

THE SCIENCE OF WHAT'S POSSIBLE.™

- Sample solubility
- Number of analytes
  - How many peaks of interest are you trying to separate?
- Chemical structure(s)
- Functional groups; how the analytes differ
  - Ionizable species? How will pH influence chromatography?
- Detection
  - Type of detection that is required or possible?
- Concentration range and quantitative requirements
- Sample matrix effects

# Different Ligands: Different Selectivity

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.™

- Changes in hydrophobicity
  - Longer alkyl chain will provide greater retention
- Changes in silanol activity
  - Affect peak asymmetry and influences secondary interactions
- Changes in hydrolytic stability
  - Longer column lifetimes with greater number of ligand attachment points to the particle surface
- Changes in ligand density
  - Influences sample loadability

# BEH Chemistries of UPLC Technology

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>™</sup>

## ■ BEH C<sub>18</sub>

- Trifunctionally Bonded C<sub>18</sub>
- First UPLC® column choice
- Superior peak shape & efficiencies

## ■ BEH C<sub>8</sub>

- Trifunctionally Bonded C<sub>8</sub>
- Wide pH range

## ■ BEH Shield RP18

- Monofunctionally bonded
- Embedded carbamate group
- Alternate selectivities

## ■ BEH Phenyl

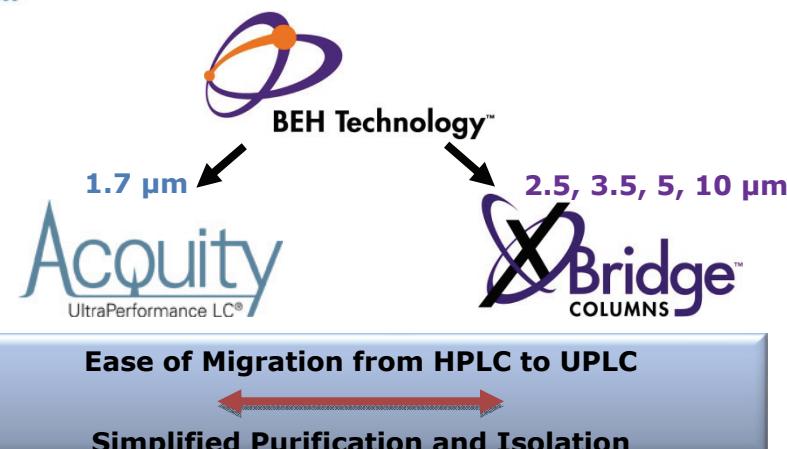

- Trifunctionally Bonded C<sub>6</sub> (Hexyl) Phenyl
- Unique combination of chemistry & particle
- Wide pH range

## ■ BEH HILIC

- Unbonded, rugged BEH particle
- HILIC for very polar bases

# Challenges of Developing and Manufacturing UPLC Particles

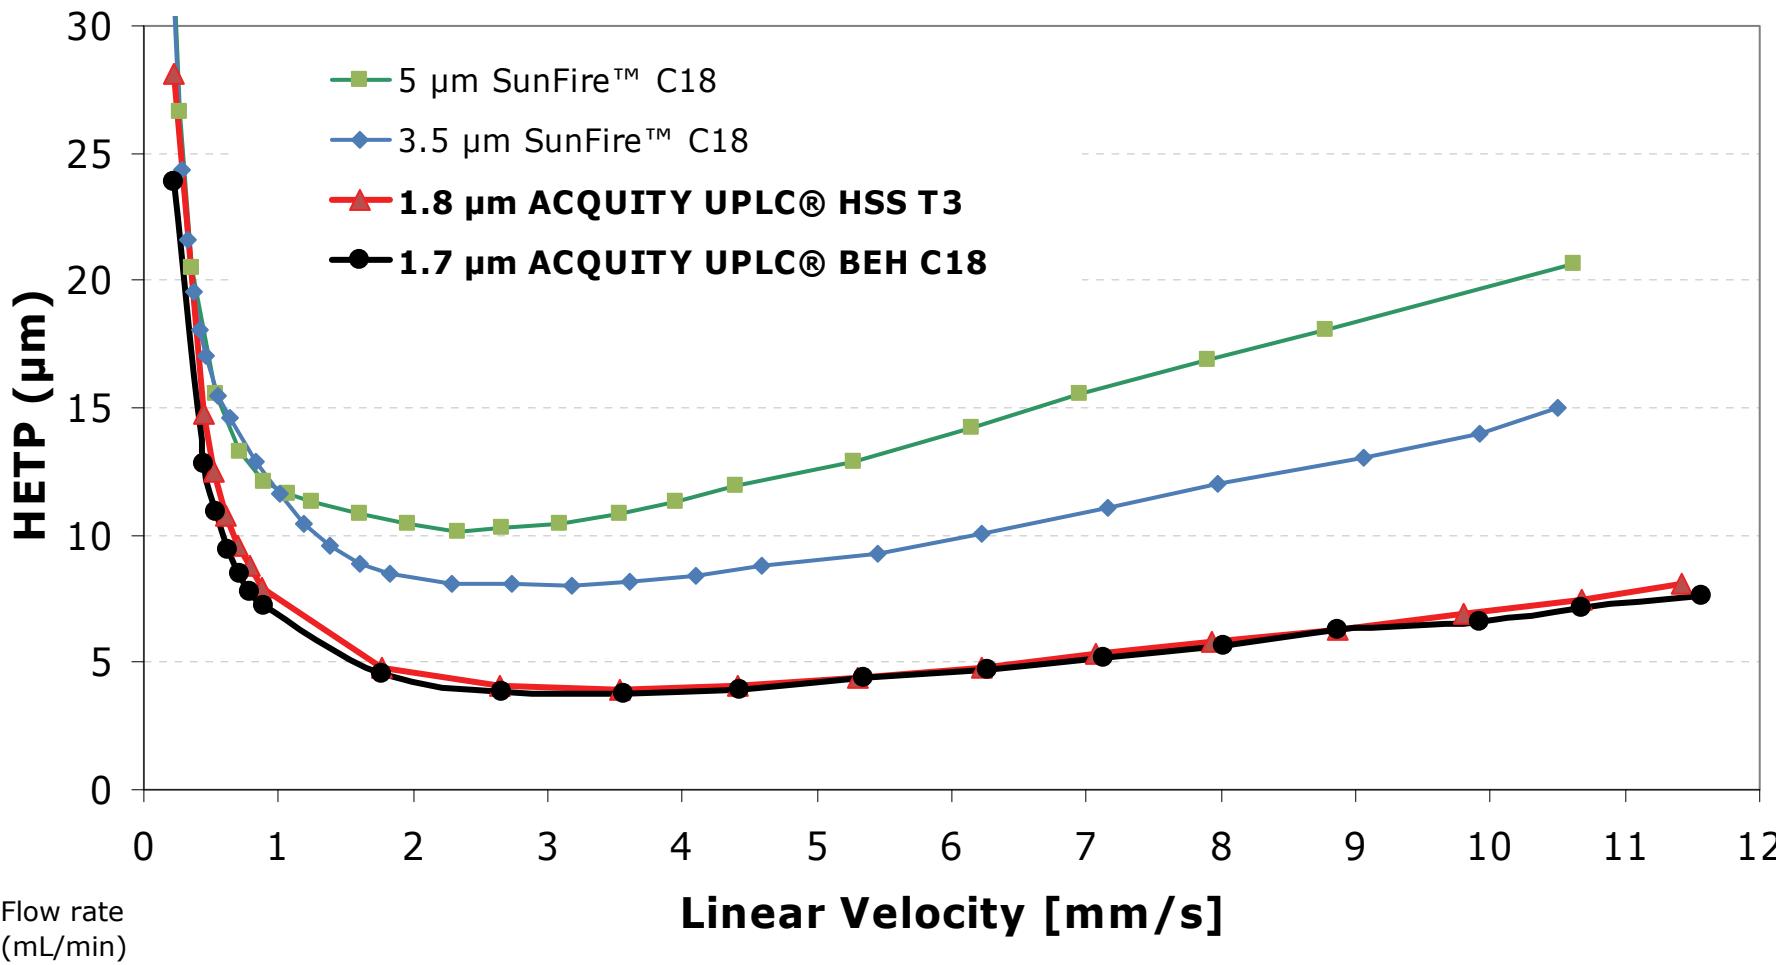

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>TM</sup>

- Developing UPLC particles requires:
  - R&D scientists capable of synthesizing, sizing and evaluating prototype sub-2 µm chromatographic media
  - Cutting-edge synthesis facilities capable of reliably and reproducibly producing commercial quantities of bulk materials
  
- UPLC particle requirements:
  - Pressure tolerance
  - Proper morphology
  - High efficiency/mass transfer
  - Advanced bonding and endcapping processes

*Additional requirements as compared to HPLC particles*

Large differences  
in stationary  
phase selectivity  
with un-ionized  
analytes and  
methanol as  
organic modifier

# Selectivity Observations

- Analytes in their un-ionized forms yield greater retention
- Methanol increases retention of all components compared to acetonitrile
- Large differences in selectivity are observed when change in pH alters charge state
- These four bonded phases yield similar results employing acetonitrile
- Largest selectivity differences between bonded phases occurred with methanol as organic modifier and analytes in their un-ionized state

# Selectivity Summary

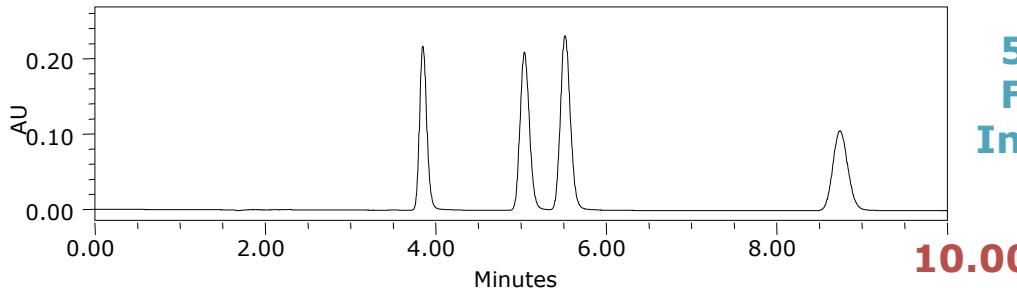

- Manipulation of parameters for method development remain the same, HPLC or UPLC separations
  - Acetonitrile and methanol
  - pH 3 and pH 10
- BEH particle technology enables the exploration of pH extremes in method development
  - Stability from pH 1 - 12
- Under the conditions and analytes of this study, large selectivity differences occurred between bonded phases with
  - Methanol as organic modifier
  - Analytes in their un-ionized state
- Evaluation of data from the complete screening matrix was essential to fully understand the analytes' chromatographic behavior

***Why UPLC technology for method development?***

# Illustrating the Method Development Approach

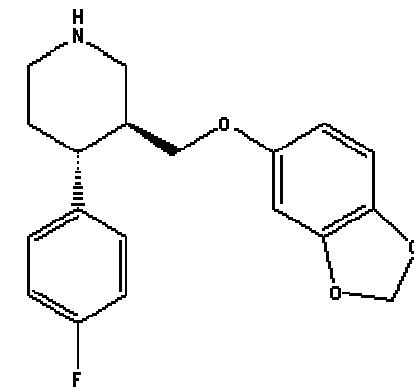

- As we go through the data for each separation, we should have some questions in mind to help select the best pH, organic solvent and column
  - Do I need resolution of every peak or simply my main component?
  - How much resolution do I need?
  - How much retention do I need and what is the retention profile?
  - What are the tailing factors?
  - Do I want a gradient or isocratic method?
- Step 1: Review data and select pH
- Step 2: Review data and select organic solvent and column
- Step 3: Optimize/fine-tune separation

# Automated Method Development and Validation of Paroxetine and Related Compounds

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>TM</sup>

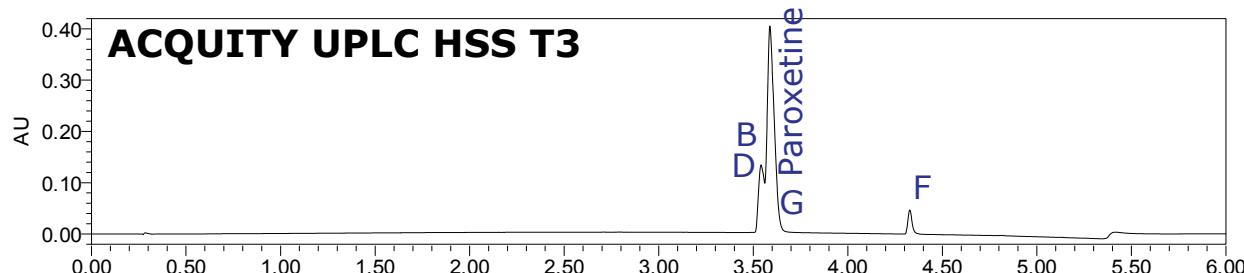

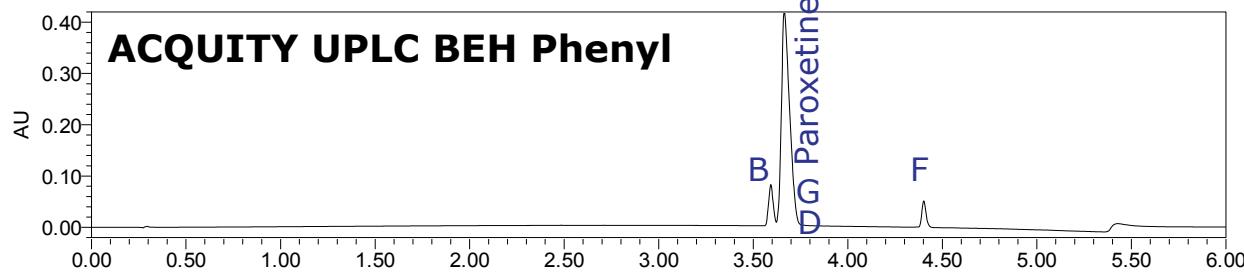

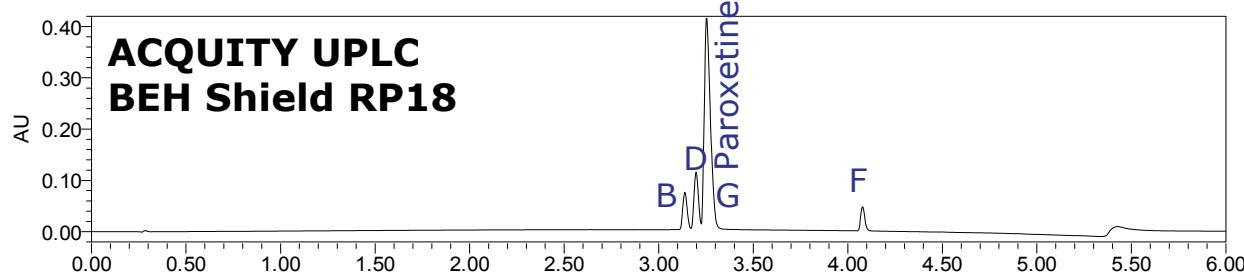

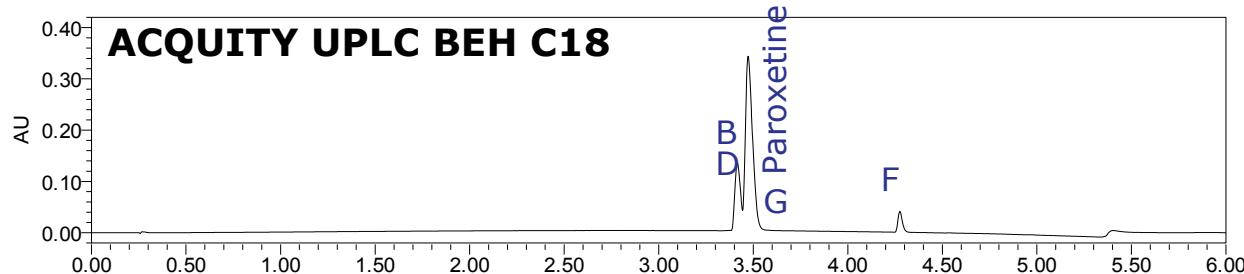

- Method Development
  - Use systematic screening protocol
  - Paroxetine (API) concentration: 0.2 mg/mL in 50:50 MeOH:H<sub>2</sub>O
  - Related compounds at 10% concentration of API for easy identification during scouting
- Method Optimization
  - Related compounds at 0.1% concentration of API
    - Related compounds B, D, F and G
- Method Validation
  - Empower<sup>TM</sup> 2 Method Validation Manager

Paroxetine  
m.w. 374.8

# Stationary Phase Selectivity: Paroxetine

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>TM</sup>

**Methanol pH 3.0**

## Observation:

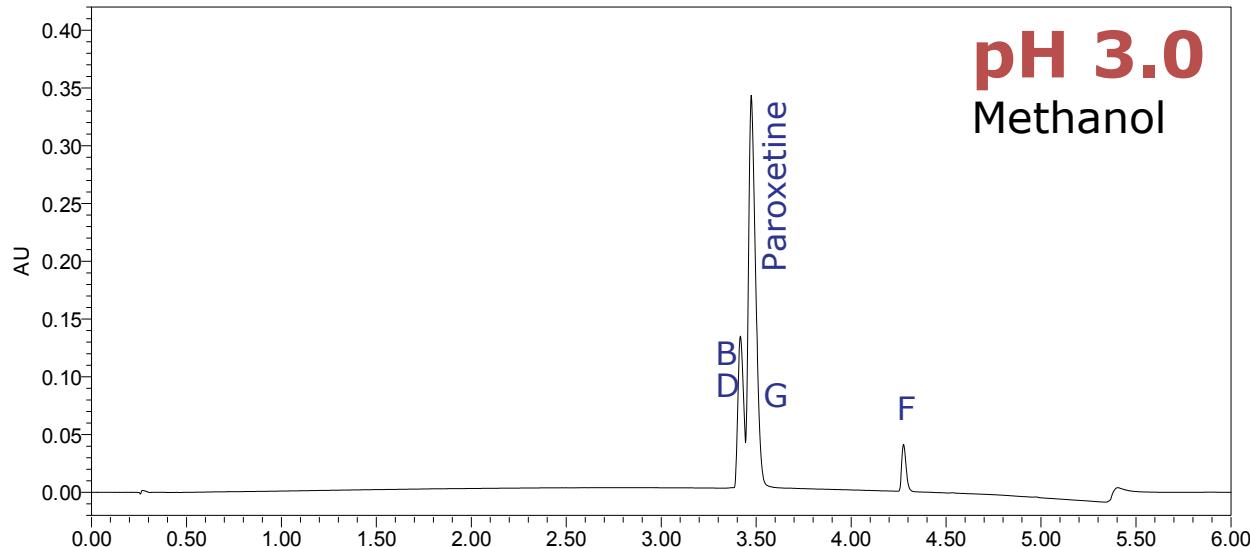

Poor resolution of paroxetine and related compounds (RC)

## Action:

Investigate high pH

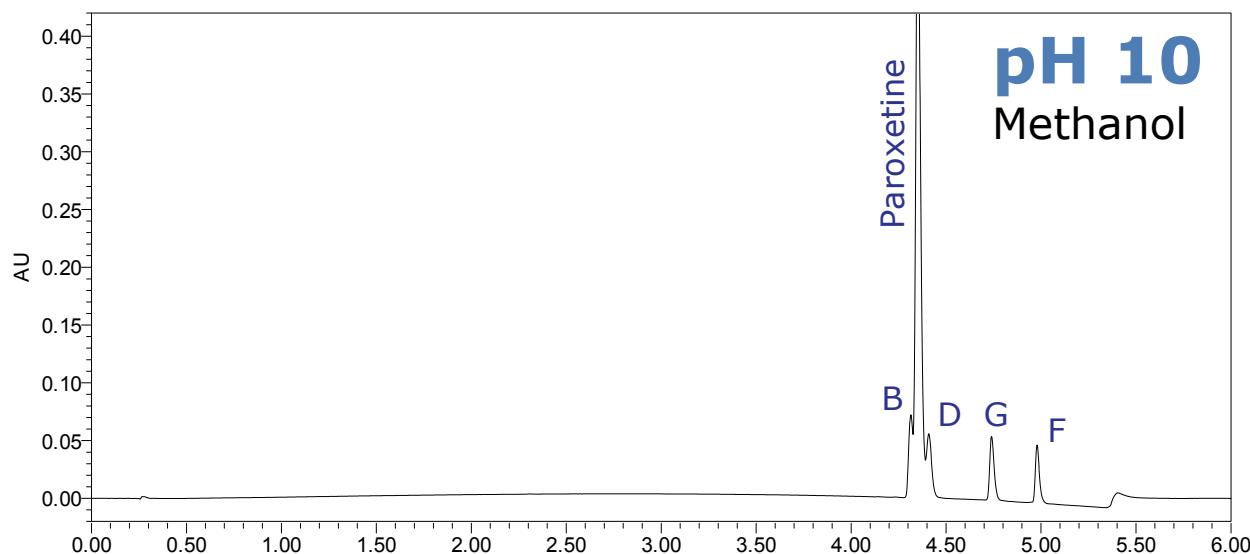

# pH Selectivity: Paroxetine

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>TM</sup>

**pH 3.0**

Methanol

**pH 10**

Methanol

## Observation:

Better retention and resolution of API from RC due to neutral charge state of analytes at alkaline pH

## Actions:

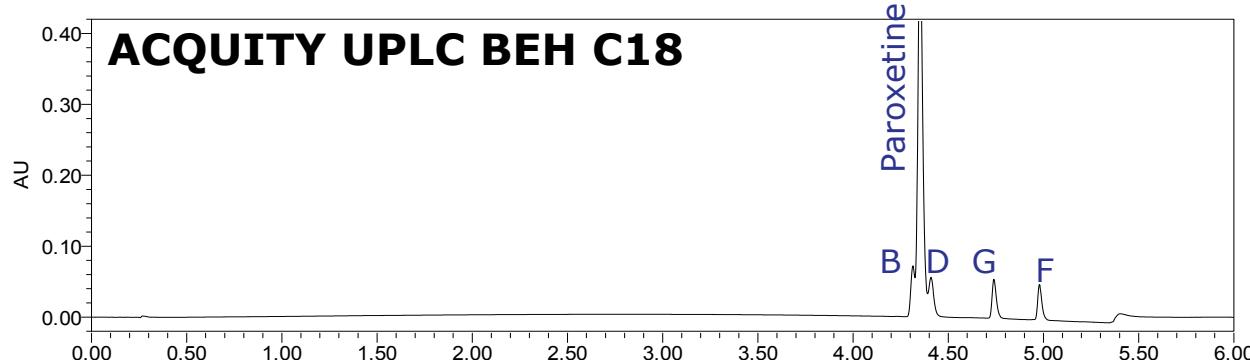

Select pH 10 due to better separation

Compare stationary phase selectivity with pH 10 buffer

# Stationary Phase Selectivity: Paroxetine

Waters

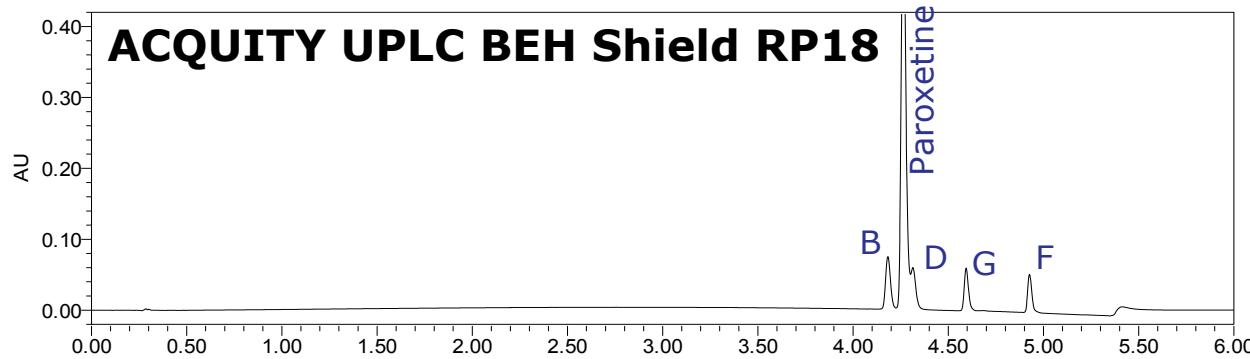

THE SCIENCE OF WHAT'S POSSIBLE.™

**Methanol pH 10.0**

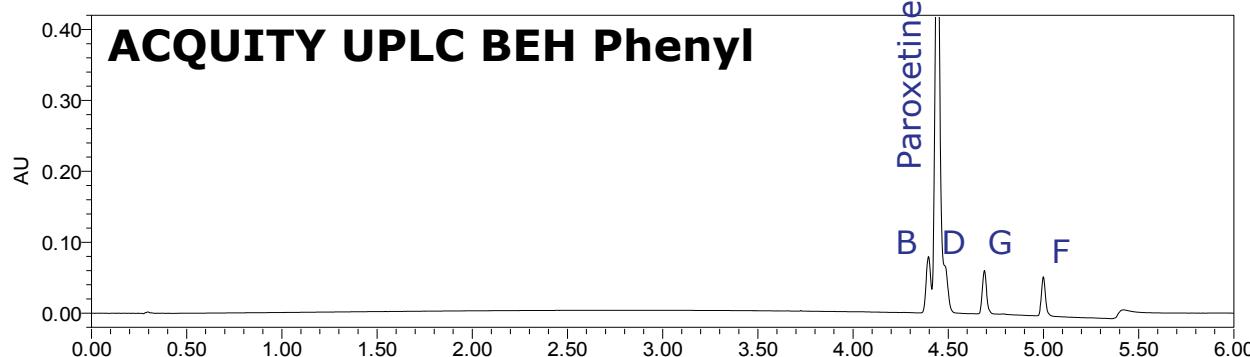

## Observation:

Any column may provide successful separation

## Actions:

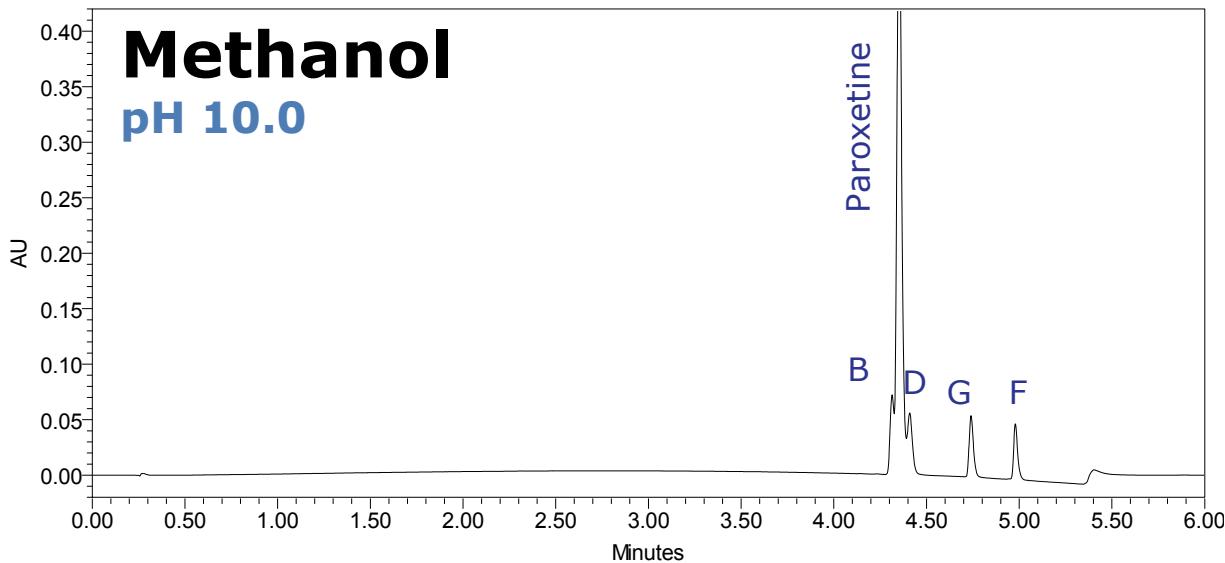

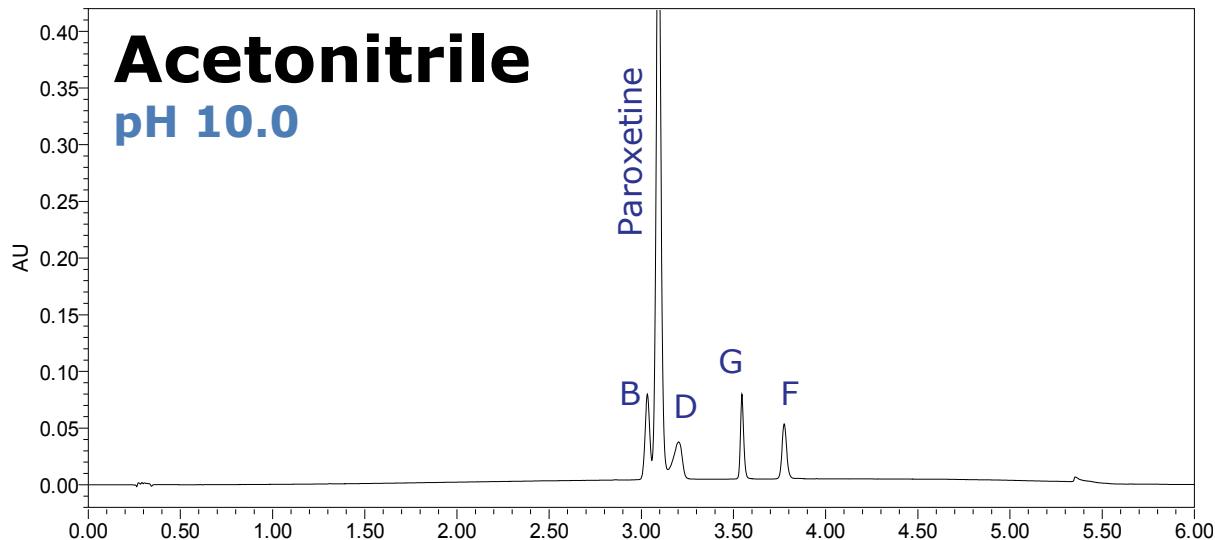

Select ACQUITY UPLC BEH C18

Compare selectivity between organic modifiers

# Solvent Selectivity: Paroxetine

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>™</sup>

## Observations:

Methanol is weaker elution solvent resulting in greater retention

Better resolution exhibited with acetonitrile as organic modifier

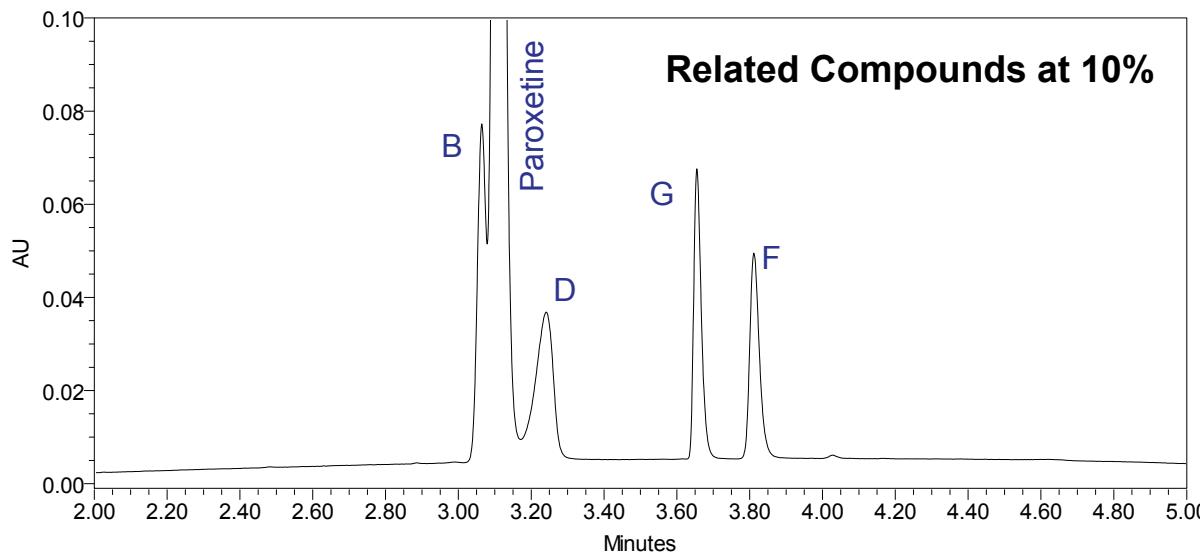

## Actions:

Select acetonitrile as organic modifier

Optimize separation using appropriate concentration of RC

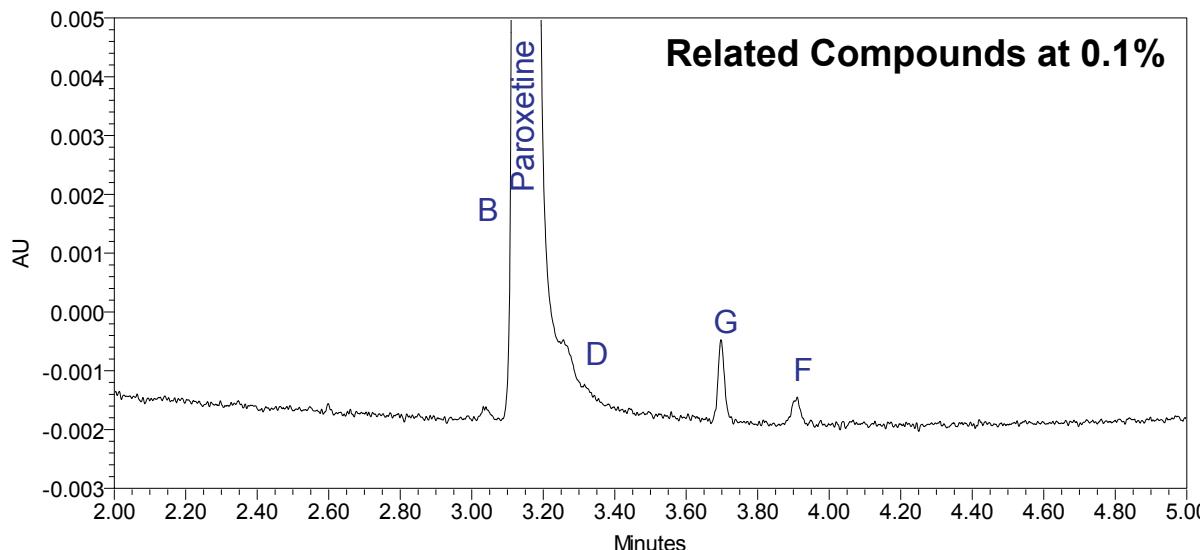

# Related Compounds at 0.1% Concentration of Paroxetine

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>TM</sup>

## Observation:

Inadequate resolution among paroxetine and related compounds B and D due to disparate levels of concentration

## Action:

Optimize Separation

# Factors that Control Retentivity and Selectivity: Optimization Tools

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.™

- Once the pH, mobile phase, and column are selected, the method can be fine-tuned and optimized
- Parameters for optimization
  - Gradient slope
  - Temperature

# Method Optimization: Gradient Slope

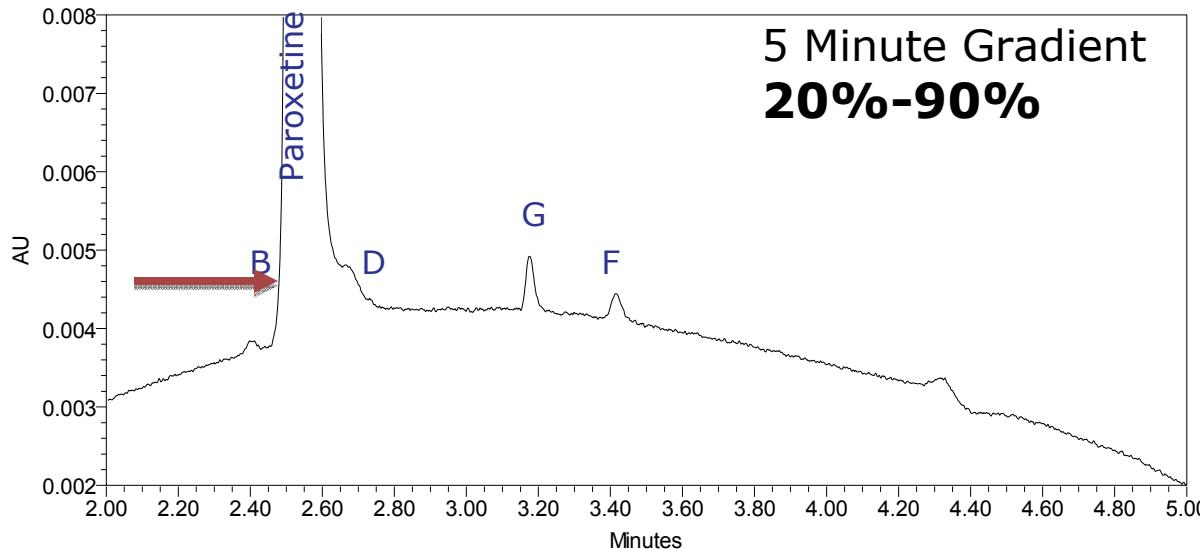

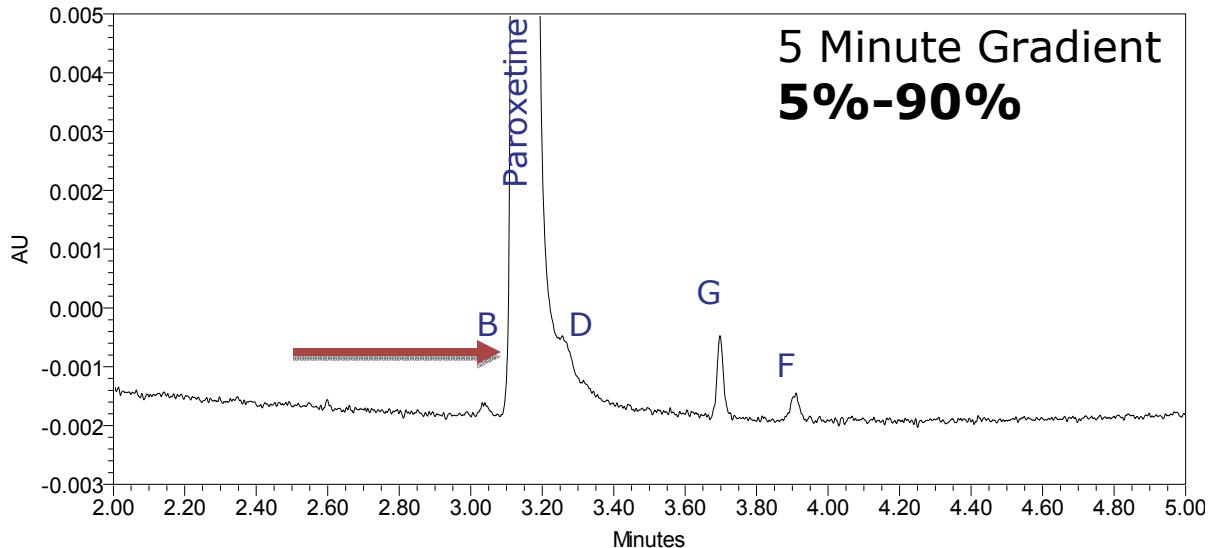

- Shallower gradient slope may improve resolution
  - Decreasing gradient slope will decrease sensitivity
- Steeper gradient slope may compress the peaks and often reduce the resolution
  - Increasing gradient slope will increase sensitivity
- Changing gradient slope is a balance between peak heights relative to resolution
- Changes in retentivity and selectivity

# Method Optimization: Gradient Slope

AQUITY UPLC® BEH C18

Waters

THE SCIENCE OF WHAT'S POSSIBLE.™

**Acetonitrile pH 10.0  
30 °C**

## Observations:

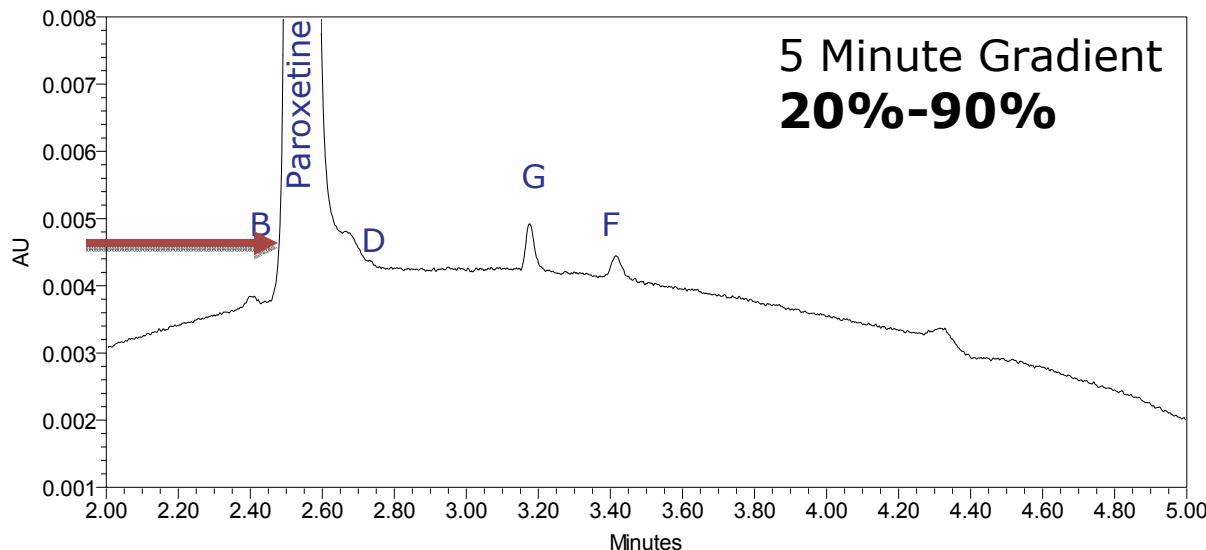

Marginal improvement in separation of RC from parent compound with shallow gradient slope

## Action:

Alter gradient endpoint to produce shallower slope

# Method Optimization: Gradient Slope

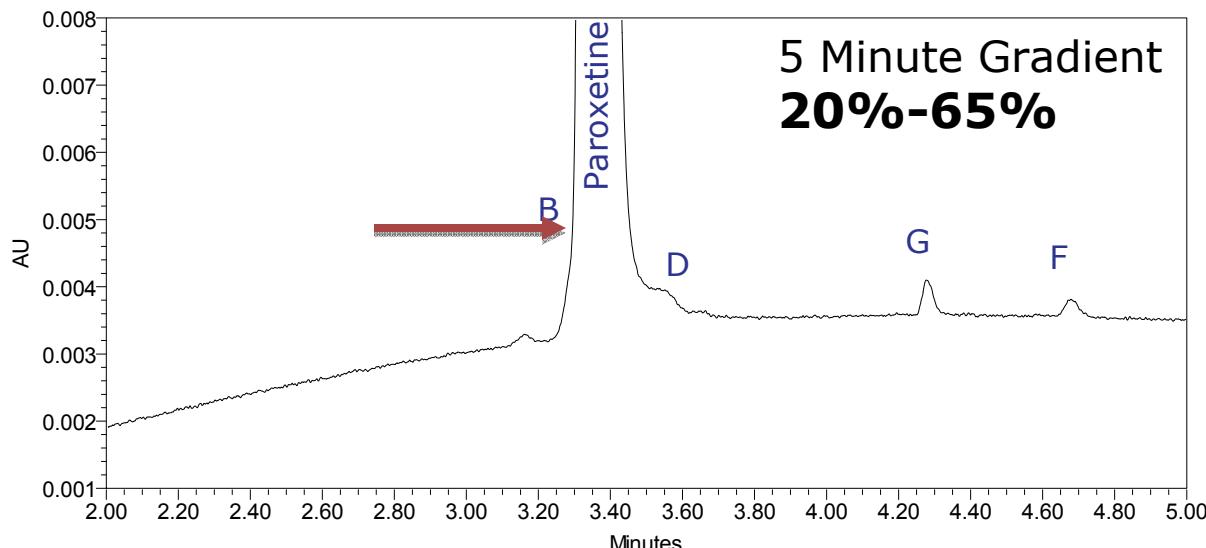

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>™</sup>

**Acetonitrile pH 10.0  
30 °C**

## Observations:

Resolution remains inadequate with shallow gradient slope

## Action:

Investigate column temperature

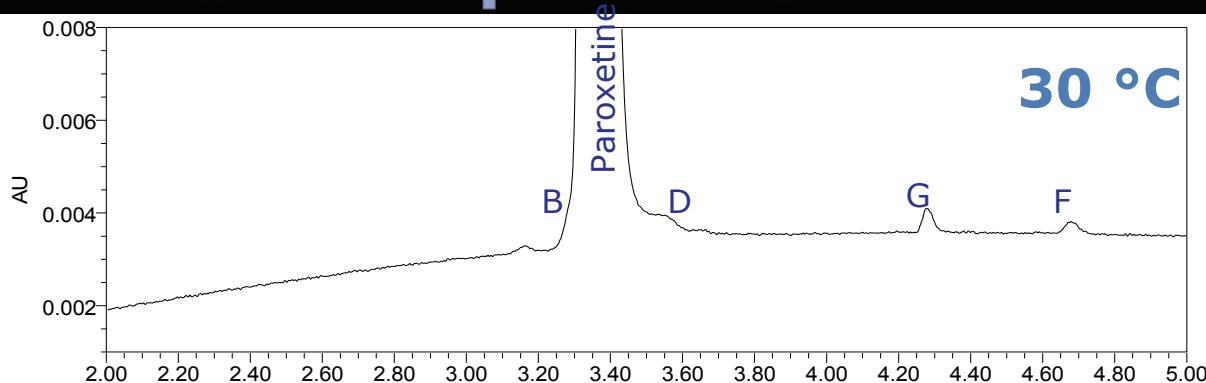

# Method Optimization: Influence of Temperature

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.™

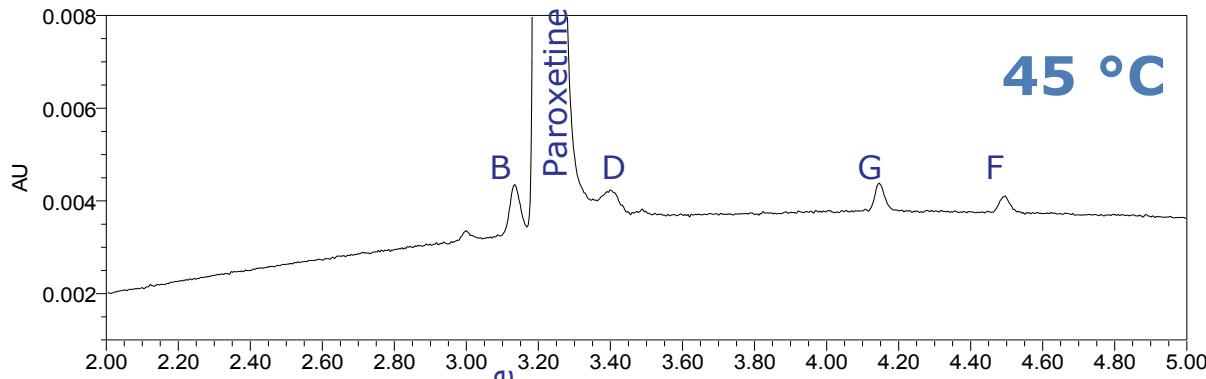

- Reduced mobile phase viscosity
- Lower backpressure
  - If flow rate is held constant
- Improve analyte diffusivity
  - Higher optimal linear velocity
- Changes in retention and selectivity

# Method Optimization: Column Temperature

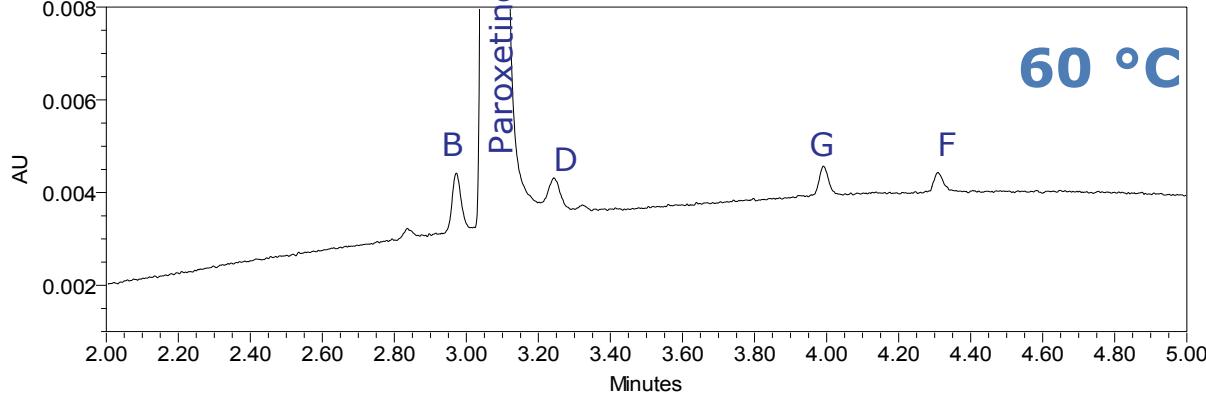

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.<sup>TM</sup>

30 °C

45 °C

60 °C

**Acetonitrile pH 10.0**

## Observations:

Higher temperature improves separation of RC from paroxetine

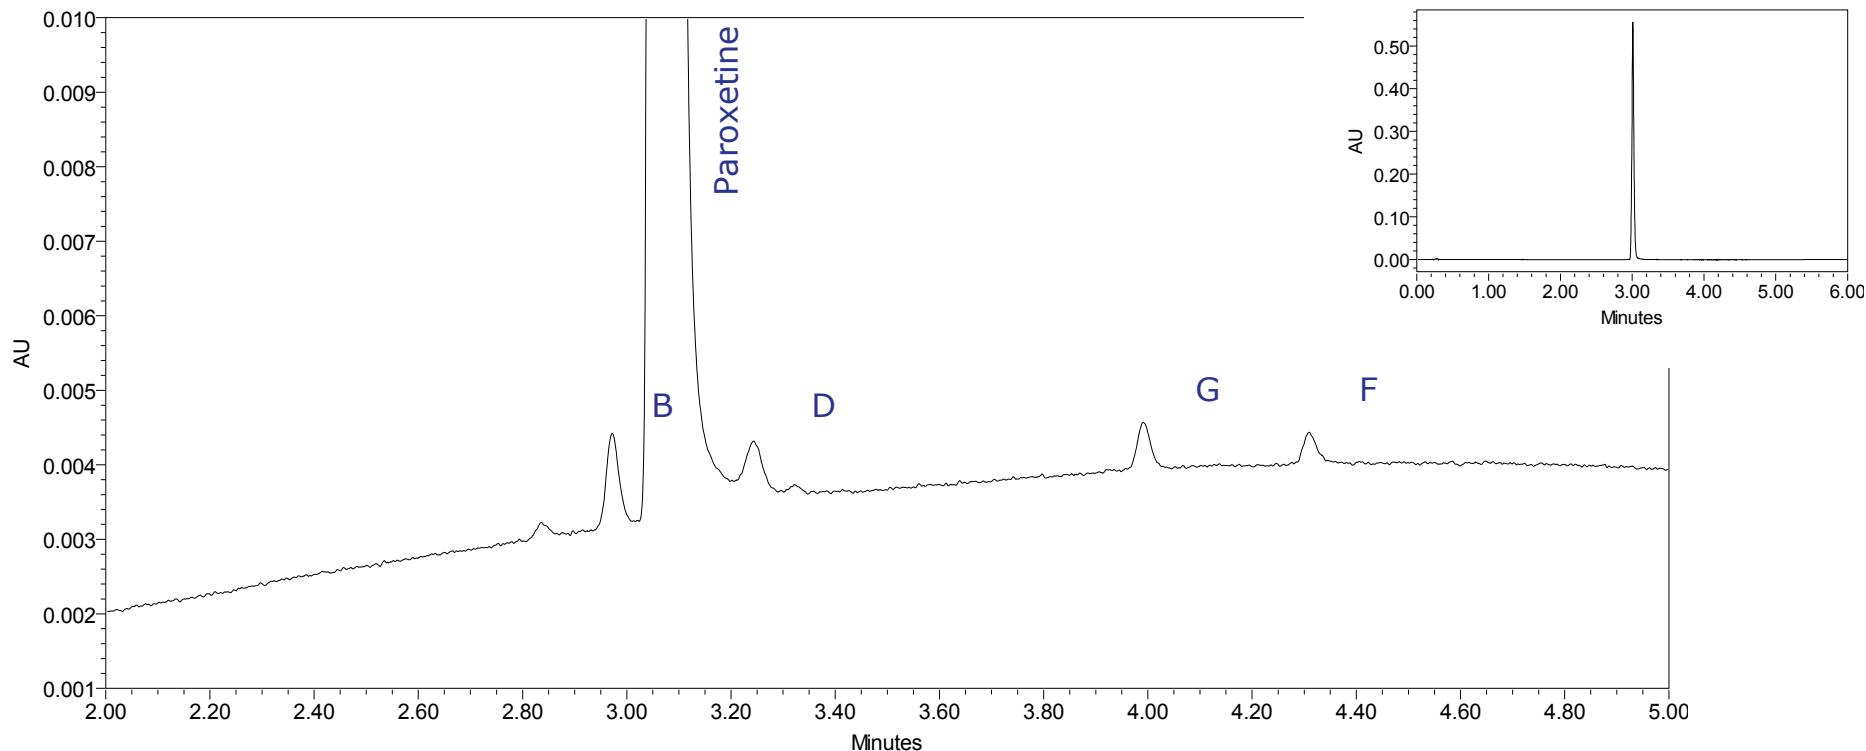

Peak shape improves as temperature increases

## Action:

Select 60 °C for best resolution and peak shape

# Final Method: Paroxetine and Related Compounds at 0.1%

Compound	USP Rs
Related compound B	
Paroxetine	1.95
Related compound D	3.07
Related compound G	13.00
Related compound F	6.74

ACQUITY UPLC BEH C18  
2.1 x 50 mm, 1.7  $\mu$ m  
20 mM ammonium bicarbonate, pH 10  
60 °C  
5 Min Gradient, 20%-65% acetonitrile  
F = 0.5 mL/min  
Inj. Vol. 4  $\mu$ L  
UV @ 295 nm

Parameter	Acceptance Criteria	Reported Value	Pass/Fail
<b>Linearity</b>	$R^2 \geq 0.995$	0.9999	pass
	Residuals $\leq 2.0\%$ RSD	1.74% RSD	pass
<b>Accuracy</b>	80 – 120 %	97 – 102 %	pass
<b>Intermediate Precision</b>	Variance Component $\leq 10\%$ RSD Peak Area (Analyst, Instrument, Column)	Analyst 1.33% RSD Instrument 7.72% RSD Column 0.00% RSD	pass pass pass
<b>LOD of impurities</b>	Impurities 0.1% of active at 0.2 mg/mL	0.05% of active at 0.2 mg/mL (s/n 2.2 – 6.23)	pass
<b>Method Robustness Peak Area</b>	Variance Component $\leq 2\%$ RSD Peak Area (Buffer strength, Additive Conc., Column Temperature)	0.06 – 1.64% RSD	pass
<b>Method Robustness Retention Time</b>	Variance Component $\leq 5\%$ RSD Retention Time (Buffer strength, Additive Conc., Column Temperature, Flow Rate, Injection Volume)	0.00 – 2.57% RSD	pass

# Method Development and Validation Timeline: Instrument Time

Waters  
THE SCIENCE OF WHAT'S POSSIBLE.™

## **UPLC Method Development and Validation Timeline**

2.1 x 50 mm, 1.7 µm, 0.5 mL/min

<b><u>Screening</u></b>	<b><u>Time</u></b>
4 Columns, 2 Organics, 2 pHs	7.0 hours
<b><u>Optimization</u></b>	
Gradient Slope and Temperature	1.7 hours
<b><u>Validation</u></b>	
Accuracy, linearity, repeatability, Reproducibility, LOD/LOQ, Intermediate precision, robustness	21.1 hours

**TOTAL TIME**

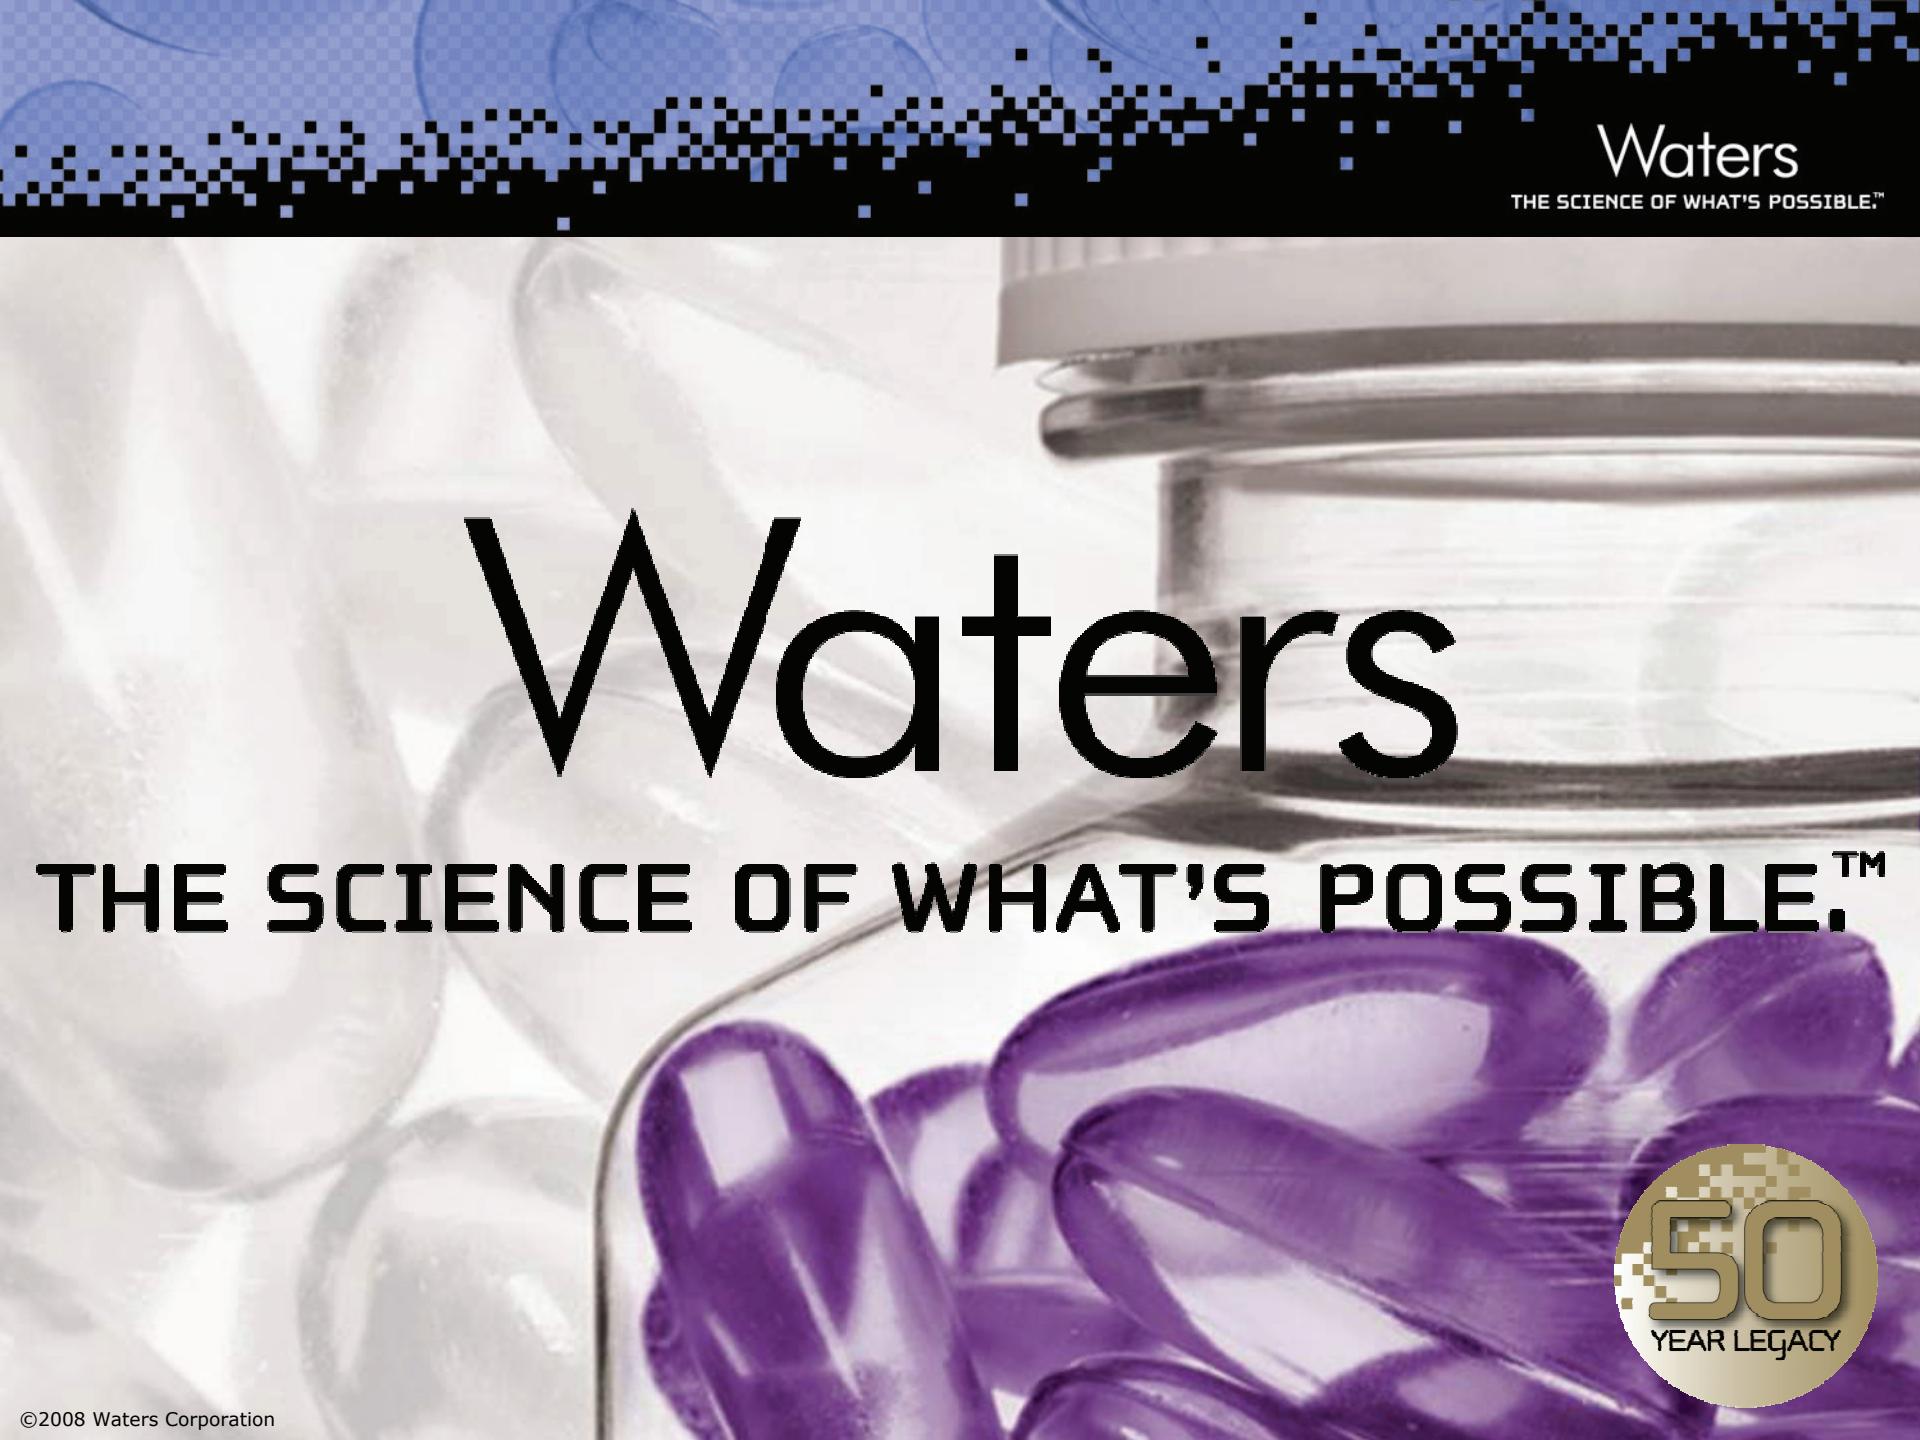

**29.8 HOURS**

# Conclusions

- Achieve **more resolution, faster** by utilizing sub-2 µm UPLC columns
- Principles of method development remain the same
- **Broad range of column selectivity** to successfully develop methods efficiently
  - BEH C<sub>18</sub>, BEH Shield RP18, BEH Phenyl and HSS T3
- UPLC Technology allows for **efficient method development**
  - Systematic scouting protocol
  - Automated column selection
  - High resolution sub 2 µm column technology
- UPLC Technology and Empower 2 software can significantly **improve laboratory productivity and compliance**
