

Analysis of Veterinary Drugs in Chicken Tenders Using the Quadrupole Time-of-Flight Mass Spectrometer

Yuki Ito and Junna Nakazono

User Benefits

- ◆ It enables comprehensive measurement of veterinary drugs by full scan analysis using the LCMS-9030, which can obtain accurate mass.
- ◆ Extracted ion chromatograms (XIC) with narrow m/z range can provide peaks with less noise and fewer contaminants.
- ◆ It is possible to perform highly sensitive analysis that covers the lower limit of quantitation required for routine analysis.

Introduction

Veterinary drugs are used for various purposes such as prevention and treatment of diseases and growth promotion of livestock and farmed fish. While veterinary drugs enable a stable supply of livestock and seafood products, there is a problem of health risks due to drug residues. For this reason, each region and country has established maximum residue limits (MRLs) for veterinary drugs in food and strictly regulates them.

Currently, triple quadrupole mass spectrometers, which can perform quantitative analysis highly selectively and highly sensitively, are widely used for the analysis of veterinary drugs in food. However, this method can only detect the envisaged target compounds, and there is a limit to the number of compounds that can be measured at one time. Therefore, this method has limited comprehensiveness for use in screening applications. Against this background, comprehensive analysis for veterinary drugs in full scan mode using a high-resolution mass spectrometer is attracting attention.

This article introduces an example of comprehensive analysis of veterinary drugs in chicken tenders using a quadrupole time-of-flight mass spectrometer LCMS-9030 (Fig. 1).

Sample Preparation

Commercially available chicken tenders were used in this analysis. Also, a mixture standard solution (Hayashi Pure Chemical Ind., Ltd. and FUJIFILM Wako Pure Chemical Corporation), which consist of sulfa drugs and quinolone drugs were used as the veterinary drugs for this analysis. The extraction and purification for chicken tenders were performed according to the STQ-LC method¹⁾ with repeated extraction developed by AiSTI SCIENCE Co., Ltd. The detailed preparation processes are shown in Fig. 2. In addition, by adding a fixed concentration of standard solution to the chicken tenders, the recovery rate for losses in the preparation process and matrix effects were also evaluated.

■ Analytical Conditions

For the analysis of veterinary drugs, the method included in the LC/MS/MS Method Package for Veterinary Drugs Ver. 2 was applied to the LCMS-9030. The HPLC and MS conditions are shown in Table 1.

■ Compound List for Veterinary Drugs

Table 2 shows the compound list of 39 veterinary drugs used in this experiment. Theoretical *m/z* values of compounds were calculated using LabSolutions Insight Explore™.

■ Full Scan Analysis by LCMS-9030

Full scan analysis was performed for the 39 veterinary drug standard mixture diluted to 1.25 ppb, veterinary drug added chicken tenders extract (concentration of each veterinary drug after sample preparation was 1.25 ppb), acetonitrile and veterinary drug-free chicken tenders extract as blank solution. Fig. 3 shows the extracted ion chromatogram (XIC) of each of the 39 compounds in each sample solution. The XICs were

drawn with ± 20 ppm tolerance for theoretical m/z values.

All 39 compounds were detected at a concentration of 2.5 ppb from the veterinary drug added chicken tenders extract (Fig. 3-D). Furthermore, almost no contaminant signals were detected in blank solutions (Fig. 3-A, B), indicating that the LCMS-9030 has sufficient resolution for full scan analysis of veterinary drugs.

Linearity of Calibration Curve

Linearity of the calibration curve for each compound was evaluated by generating a 6-point calibration curve with the range 0.25-50 ppb in solvent and in chicken tenders extract. Both in solvent and in extract, linearity showed very good results (coefficient of determination R^2 : 0.99 or more) for all

compounds. Calibration curves for Sulfamethoxazole, a sulfa drug, and Enrofloxacin, a quinolone drug are shown respectively in Fig. 4 and 5 as an example, and calibration ranges for all 39 compounds are shown in Table 3.

■ Spike and Recovery Test

A spike and recovery test was performed using chicken tenders extract to which 39 veterinary drugs mixture standard solution was spiked at 0.01 mg/kg per sample (concentration in pretreated sample solution was 1.25 ppb), and the recovery rate and mass error (n=6) were evaluated. The results of recovery rate, reproducibility (%RSD), and mass error are shown in Table 4, and the breakdown of recovery rate is shown in Fig. 6.

Recovery rates were 70-120 % for 32 of the 39 compounds. Good recovery rate and reproducibility were obtained without significant matrix inhibition, even in solutions containing high sample concentration.

■ Conclusion

The STQ-LC method with repeated extraction made it possible to speed up and simplify the preparation process. Full scan analysis of pretreated chicken tenders samples using LCMS-9030 provided good results for spike recovery rate, reproducibility, and linearity. It was demonstrated that the analytical method introduced in this article enables "rapid, simple, and highly precise" analysis, and is useful for the analysis of veterinary drugs in food.
